"Mobility is Our Business"

Problem:

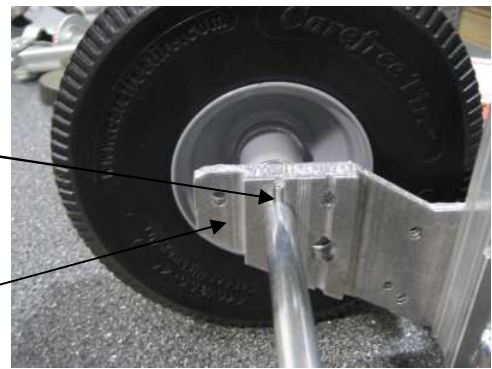

A B&P axle bracket is warranted for life "...not to crack or break." This warranty, however, does not extend to "wallowing." Wallowing is a condition where by the axle hole in the bracket is enlarged by a loose fitting or spinning axle.

Solution:

This condition can be avoided by proper installation of the roll-pin designed to keep the axle tight and preventing it from rolling in the hole.

Bracket

Cotter-Pin

Washers:
Thin &
Thick

Problem:

Bearings can wear prematurely if the wheel is not properly spaced on the axle. Also, improper lubrication can cause bearing failure.

Solution:

Washers should be used to keep the wheel from excess lateral movement along the axle. Too few washers = excess movement. However, you also don't want the wheel to bind. Too many (or too thick) washers = bound wheel. (wheel will not spin freely) Also, DO NOT lube wheels with grease! FORGET THE ZIRK!! A shot or WD-40 once every month or two is all you need.
